

**Abstract of the Disclosure**

5           A pegboard system for constraining items of cargo in transit has one or more  
pegboards to cover a cargo support area, the pegboards having an upper surface with  
openings for pegs, and a plurality of pegs sized to fit into the openings in the pegboards  
to constrain the items of cargo from substantial lateral movement. In some cases there  
are elastic top elements for pegs to protect items of cargo, and straps between pegs to aid  
10 in constraint of the items of cargo.
